TPW - Project2

Project: DjanGoMarket

Vitor Alves - 104296
Filipe Viseu - 119192
Samuel Vinhas - 119405

Professor
Hélder Zagalo

Context

Objective:

Web-based information system developed to help manage supermarket operations
Our app serves as a hub for managing supermarket operations including:

- Management of different supermarkets
- Employee and personnel management
- Product inventory and warehouse organization

Models

Implemented models:

- **Supermarket** - Store locations with opening/closing times
- **Section** - Product sections/departments
- **Employee** - Staff management with roles, hierarchy (supervisor relationships), and salary tracking
- **Product** - Product catalog with pricing and temperature requirements
- **Warehouse** - Inventory storage locations
- **Distributor** - Supplier information
- **Client** - Customer data with fidelity program tracking
- **Purchase** - Transaction management with multiple payment methods
- **Order** - Supermarket orders with discounted pricing

Frontend

Angular SPA Components:

- **Angular 21:** Standalone components with lazy-loaded routing
- **Entity Views:** Full CRUD interfaces for all 9 database entities
- **TokenInterceptor:** Bearer injection + silent 401 token refresh
- **AuthService:** JWT token management + user state
- **AuthGuard:** Only allow users logged in
- **AppRoutes:** All routes; entire app behind authGuard except /login

API

Django REST Framework:

- **Full CRUD** via `ModelViewSet` for all 9 entities: Supermarket, Section, Employee, Product, Warehouse, Distributor, Client, Purchase, Order
- **JWT authentication** via `django-rest-framework-simplejwt`: login with employee number and password, receive access + refresh tokens
- **Nested serializers**: purchases and orders include their line items on read
- `/api/me`: current user profile including group, supermarket, and supervisor
- `/api/me/ PATCH`: profile editing (name, contact, age, sex)
- `/api/me/password/`: authenticated password change
- `/api/health/`: unauthenticated health check

User Authorization

RBAC - DjangoModelPermissions:

- **Login:** sends '{enumber, password}' to /api/token/ and stores the returned JWT pair
- **API requests:** carry 'Authorization: Bearer <access_token>'
- **Group model:** same as TP1, enforced at API level via Django model permissions
 - **CEO:** full CRUD across all supermarkets; 'is_staff=True', admin panel access
 - **Manager:** full CRUD scoped to their supermarket; read-only on products, sections, distributors
 - **Cashier:** create purchases; read-only elsewhere
 - **Employee:** read-only across their assigned supermarkets
- **Non-CEO users:** cannot edit or delete CEO employees
